How To Make PlainText In Inserting the password in kloxo

for example i will add a client, when the client is already added the password is encrypted in phpadmin, so how can i make the password plaintext in phpadmin when i add a new client again?

ill wait for the response i want to know this badly

thank you

please help me

im using a plug in to have a multi server in openvpn.... i cant use the password as authentication for the openvpn when i add a client using the password that then i wont work.... im using email-adress box for authentication because its a plaintext and the password is useless... so how can i make the password in kloxo as a plaintext when i add or change password?

You can create a script to add the user account. The script can generate the password and specify it in the creation line, you can then have the script email the user with that password.

I'm not sure what you mean. If doing this manually, you will copy the generated password before continuing. If you have created a script to do this you have to email or otherwise save that password before the script completely ends. If you give full details of what you are already doing, I can explain further.

When we create new customer, we can found 'Welcome message'. So, on plaintextpassword issue, set your email address to 'Email address' and enable 'Send Welcome message'.

sir thats not it if i create a client in kloxo.... how can i insert the password without encryption? if

that's not necessary how can i edit the script in add button to make a password plaintext without encryption

can you help me please thank you

@plaintextpassword,

Imagine, you want make client with name 'client1' and have 'abc@yourclient.com' contact. You are, as admin, have 'you@domain.com'. So, in 'Welcome message', you can set 'client1' in 'Client Name', set 'you@domain.com' on 'Email Address' and enable 'Send Welcome Message'.

With this step, you can received welcome message (naturally for your client) including plain password information.

Maybe, in 6.1.7 possible to set 'Email Address' with more than 1 account (say it, 'abc@yourclient.com, you@domain.com').

ok sir thats good.. but in the phpmyadmin if you look in to the password its encrypted... for example i put 123456 for the password if you look in phpmyadmin its gonna be like Ui34Sqsd its encrypted like that so how can i add a client in kloxo if i put a password in password box like 123456 and it will show in phpmyadmin 123456 in the password field.. i dont want to encrypt passowrd in phpmyadmin to insert i want to make a plaintext to insert in the password field in client tables

---

plaintextpassword - short answer is you can't. Better question is why would you want to. You could go in the code where it does it and change that. Just let your customers know that their password is not encrypted in your database against the standard Kloxo practice so they can be warned. This is the kind of stuff that leads to massive breaches of many systems if your server is ever compromised. They grab the DB, parse it, and then use all the passwords against the email addresses to do spam and such. Just really not a good idea...
