I can offer just about any OS that a customer may need if he has it licensed. The Windows 2008 is the evaluation and can be activated by the user or will shutdown every hour or so. I plan to Add FreeBSD, NetBSD, and some others in the future as well.

Each template uses its own kernel as pygrub is enabled by default. This gives you full control over your kernel.

Well, i must inform all the members here, all the readers from all the world, about the mercury company.
I have use services from the mercury vps, for 1 month and more, testing their quality in various sectors.

My results:

1) Support:
The support is very friendly and very skilled. They can help you with anything. I mean it. A N Y T H I N G. They don't laughing with you, they speaking with kindness and they are very helpful. Their knowledge and their skills is truly unbelievable, and you get your help in any matter whatever the difficulty of the subject. They have talent and expertise peoples/persons, which they do not look their clocks when giving their help. By far, the most advanced and greatest support i have see out there.

2) Quality / Speed:
One another sector of their business which they have success. Their network uptime is unbelievable, and for 1 month and more, i have see ZERO downtime. I mean it. Z E R O downtime. Their servers is in the U.S, but the speed for the Europeans is good and enough for hosting ANYTHING you can imagine. The pings are not so good for Europeans (many hops in the POP'S around the world, but is 150ms and less. Perhaps if you are in a country near to atlantic, e.x: spain, portugal, Netherlands, germany, etc, you will have much lower ping than me ---> greece.

The speed of their server is good enough, in any sector you will see. From the speed of browsing their panel --- hypervm of course --- until the speed of the virtual machine, you will get respectable speed. Such of this speed in the virtual machine (xen) i have not see in no other company, and in my honest opinion, for their prices, and their quality, other famous companys out there, is like.... a waste of moneys ghosts...

I have run in my machine apache, i have make compilations, i have do a lot of things, and the speed was... more than enough for do it anything i want.

My recomendation...?

Go to mercury vps, and take your plan. You will win in moneys, speed, quality, time.

Their.... support?

F A N T A S T I C !!!!

Go in mercury vps, you will remember me..... !!!
